

Business unit KPIs

- Appears in a “pop-up window” of its own, (technically a layer within the web site).
- Users select the KPI and an optional second KPI for comparison. They can then select the Business Units they wish to see on the chart
- The scale for the first indicator is shown in the left-hand axis, the scale for the comparison indicator is shown on the right.
- The overall Group can also be shown on the chart for comparison.
- By default, only the Centrica group will be selected.
- There will need to be some way to distinguish between the two lines for each Business Unit, if two KPIs have been selected. For instance, there may be a green solid line for Direct Energy Operating profit, and a green dotted line for Direct Energy Revenue.
- Not all Business Units have the full range of KPIs available, so even if they have been selected in the list, they may not necessarily appear on the chart. This is indicated by the key to the left of the chart – a solid and/or dotted line is shown next to each Business Unit, but the relevant line will not appear here, if it does not appear on the chart.
- Caveat and commentary information will be displayed below the chart (not shown in wireframe).
- Line charts are the best way of presenting many indicators on one chart. Other chart options, such as stacked bar charts, will be available for selection (perhaps by icon) only when appropriate.

Corporate responsibility KPIs

- Appears in a “pop-up window” of its own, (technically a layer within the web site).
- Selecting data:
 - Using the drop-down menus the user selects:
 - Key impact area
 - Indicator category
 - Indicator
 - Each menu/sub-menu will update with the relevant options when the one above it is selected/changed
 - There may be accessibility issues with the way these drop-downs work, which will need to be investigated.
- Once an Indicator is selected, the Data Options for that Indicator will be available (i.e. the checkboxes in the wireframe).
 - The user can select which Data Options they wish to see in the chart. For instance, once the indicator “Generation and production > Power generation CO2 emissions” has been selected, the Data Options available will be Total, Direct Energy, UK, SPE.
 - The user may select any or all of these to be shown on the chart simultaneously.
 - For details on which Data Options are available for each Indicator, please see the document “Centrica Data Centre – CR data structure.xls v4”.
- The user may also select a second indicator for comparison, using a similar process. The scale for the comparison indicator is shown on the right-hand side of the chart.
- Caveat and commentary information will be displayed below the chart (not shown in wireframe).
